This is an interesting book which provides clear relationships between education and neuroscience. Being a neuroscientist and an academic, in my opinion this book explores various learning approaches and technologies. At the same time, it provides opportunities for reflection, hence accommodating personalized as well as realistic learning approaches.

My only criticism is that it was difficult to know which level of students it is addressing. Is it Level 4, 5 or 6 students? It would have been useful if this had been mentioned at the beginning.
